

# ICNL9706 a-Si TFT Mobile Display Driver IC Specifications

# ICNL9706

# **Specification Version**

Model No: ICNL9706

Document Version: V0.7

*Release Date :* 2017/10/26

| 8.2、Level 1 Command Description                                | - 127 - |
| 8.2.1 NOP: NOP (00h)   | 127 -   |
| 8.2.2 SWRESET: Software Reset (01h)                            | 128 -   |
| 8.2.3 RDDID: Read Display ID (04h)                             | 129 -   |
| 8.2.4 RDNUMED: Read Number of Errors on DSI (05h)              | 131 -   |
| 8.2.5 RDDST: Read Display Status (09h)                         | 132 -   |
| 8.2.6 RDDPM: Read Display Power Mode (0Ah)                     | 134 -   |
| 8.2.7 RDDMADCTR: Read Display MADCTR (0Bh)                     | 135 -   |
| 8.2.8 RDDCOLMOD: Read Display Pixel Format (0Ch)               | 136 -   |
| 8.2.9 RDDIM: Read Display Image Mode (0Dh)                     | 137 -   |
| 8.2.10 RDDIM: Read Display Signal Mode (0Eh)                   |         |
| 8.2.11 RDDSDR: Read Display Self-Diagnostic Result (0Fh)       | 139 -   |
| 8.2.12 SLPIN: Sleep In (10h)                                   |         |

| 8.2.14 NORON: Normal Display Mode ON (13h)                     | 144 -   |
| 8.2.15 INVOFF: Display Inversion OFF (20h)                     |         |
| 8.2.16 INVON: Display Inversion ON (21h)                       | 146 -   |
| 8.2.17 ALLPOFF: All Pixel OFF (22h)                            | 147 -   |
| 8.2.18 ALLPON: All Pixel ON (23h)                              |         |
| 8.2.19 GAMSET: Gamma Set (26h)                                 | 149 -   |
| 8.2.20 DISPOFF: Display OFF (28h)                              |         |
| 8.2.21 DISPON: Display ON (29h)                                |         |
| 8.2.22 TEOFF: Tearing Effect Line OFF (34h)                    |         |
| 8.2.23 TEON: Tearing Effect Line ON (35h)                      | 153 -   |
| 8.2.24 MADCTL: Memory Data Access Control (36h)                | 154 -   |
| 8.2.25 IDMOFF: Idle mode OFF (38h)                             | 155 -   |
| 8.2.26 IDMON: Idle mode ON (39h)                               | 156 -   |
| 8.2.27 COLM <mark>OD: In</mark> terface Pixel Format (3Ah)     | 157 -   |
| 8.2.28 STESL: Set Tearing Effect Scan Line (44h)               | 158 -   |
| 8.2.29 GSL: Get Scan Line (45h)                                | 159 -   |
| 8.2.30 WRDISBV: Write Display Brightness (51h)                 |         |
| 8.2.31 RDDISBV: Read Display Brightness (52h)                  |         |
| 8.2.32 WRCTRLD: Write CTRL Display (53h)                       |         |
| 8.2.33 RDCTRLD: Read CTRL Display (54h)                        |         |
| 8.2.34 WRCABC: Write Content Adaptive Brightness Control (55h) |         |
| 8.2.35 RDCABC: Read Content Adaptive Brightness Control (56h)  |         |
| 8.2.36 WRCABCMB: Write CABC minimum brightness (5Eh)           |         |
| 8.2.37 RDCABCMB: Read CABC minimum brightness (5Fh)            |         |
| 8.2.38 RDID1: Read ID1 Value (DAh)                             |         |
| 8.2.39 RDID2: Read ID2 Value (DBh)                             |         |
| 8.2.40 RDID3: Read ID3 Value (DCh)                             | 170 -   |

## 1. Features

- 1. Single chip WXGA a-Si TFT LCD Controller/driver without Display RAM.
- 2. Panel driving:
  - > 2402 source pads.
  - ➤ CGOUTL 1~22 and CGOUTR 1~22 pads for GIP timings control.
  - 1-dot / 2-dot / 4-dot / 8-dot / Zig-Zag / Column inversion. JE NITIAL
  - DC **VCOM** voltage generator and adjustment.
- 3. Display resolution:
  - > 800RGB x (480+4 x NL)
  - > 720RGB x (480+4 x NL)
- 4. Display color modes
  - > Full color mode 16.7M colors
  - Reduce color mode : 262K colors
- 5. Output voltage level
  - Positive gate driver voltage range for VGH: 10V to 20V
  - Negative gate driver voltage range for VGL: -7.0V to -16V
  - Positive gamma high voltage range for **VSPR**: 3.0V to 6.0V
  - Negative gamma low voltage range for **VSNR**: -3.0V to -6.0V
  - > GIP timings control voltage range for VGH to VGL.
  - Common electrode voltage range for **VCOM**: -0.3V to -2.2V.
  - Negative level shift voltage range for VCL: -1xVCI
- 6. Input voltage level
  - Logic and interface power supply (IOVCC): 1.65V to 3.3V.
  - Analog power supply (VCI): 2.5V to 3.3V
  - Positive source driver power supply (VSP): 4.5V to 6.5V
  - ➤ Negative source driver power supply (VSN) : -4.5V to -6.5V
  - > OTP programming voltage (**VPP**): 8.5V
- 7. Interface
  - ➤ MIPI Display Serial Interface (DSI V1.01 r11 and D-PHY V1.0)

#### 8. On-chip functions.

- Oscillator for display clock generation
- **CABC** (Content Adaptive Brightness Control) function
- Support **CE** (Color Enhancement) function
- Support **DGC** (Digital Gamma Correction) function

- ..ion register settings

# 2. Description

This document describes Chipone's ICNL9706 supports WXGA resolution driving controller. It includes a timing controller with glass interface level-shifters and a glass power supply circuit to drive a dot-matrix TFT LCD with 800 (RGB) x1280 dots at maximum.

The ICNL9706 supports MIPI DSI (Display Serial Interface) interface mode.

Four data lanes support up to 500Mbps on the MIPI DSI.

The ICNL9706 also supports various functions to reduce the power consumption of a LCD system via software control.

- > Sleep In mode
- > Deep standby mode

The ICNL9706 is suitable for any small portable battery-driven and long-term driving products, such as digital cellular phones, smart phones.

# 4. Electrical Characteristics

## 4.1 Absolute Maximum Ratings

The absolute maximum rating is listed in below table. When the ICNL9706 is used out of the absolute maximum ratings, it may be permanently damaged.

To use the ICNL9706 within the following electrical characteristics limit is strongly recommended for normal operation. If these electrical characteristic conditions are exceeded during normal operation, the ICNL9706 will malfunction and cause poor reliability.

Note 1: Spike due to an electrostatic discharge on RESET line does not cause irregular system reset according to the table below.

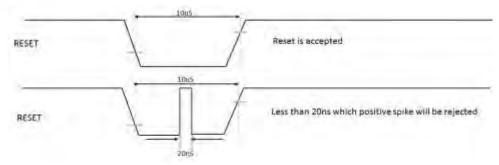

| RESET Pulse          | Action         |  |  |
|----------------------|----------------|--|--|
| Short than 5us       | Reset Rejected |  |  |
| Long than 10uS       | Reset          |  |  |
| Between 5us and 10uS | Reset Start    |  |  |

Note 2: During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120ms, when Reset Starts in sleep out mode. The display remains the blank state in sleep in mode) and then return to Default condition for H/W RESET.

Note3: During Reset Complete Time, values in OTP memory will be latched to internal register during this period.

This loading is done every time when there is H/W RESET complete time(tRESET) within 5ms after a rising edge of RESET.

Note4: Spike Rejection also applies during a valid reset pulse as shown below:

Note5: It is necessary to wait 5msec after releasing RESET before sending commands. Also Sleep Out command can not be sent for 120msec.

## 5. Interface

#### 5.1 Interface Level Communication

#### 5.1.1 General

The display module uses data and clock lane differential pairs for DSI (DSI-1M). Both differential lane pairs can be driven to Low Power (LP) or High Speed (HS) mode. Low Power mode means that each line of the differential pair is used in the single ended mode, a differential receiver is disable (a termination resistor of the receiver is disable), and it can be driven into a low power mode.

High Speed mode means that differential pairs (the termination resistor of the receiver is enable) are not used in the single ended mode.

Different modes and protocols are used in each mode when transferring information from the MCU to the display module and vice versa.

The State Codes of the High Speed (HS) and Low Power (LP) lane pair are defined below.

| Lane Pair State Code | Line DC Voltage Levels |           | High Speed (HS)  | Low Power    |             |  |  |
|----------------------|------------------------|-----------|------------------|--------------|-------------|--|--|
| Lane Pair State Code | DATA_P                 | DATA_N    | Burst Mode       | Control Mode | Escape Mode |  |  |
| HS-0                 | Low (HS)               | High (HS) | Differential - 0 | Note1        | Note1       |  |  |

| LP-00                | Low (LP)               | Low (LP)  | Not Defined      | Bridge       | Space       |  |  |
| LP-01                | Low (LP)               | High (LP) | Not Defined      | HS-Request   | Mark-0      |  |  |
| LP-10                | High (LP)              | Low (LP)  | Not Defined      | LP-Request   | Mark-1      |  |  |
| LP-11                | High (LP)              | High (LP) | Not Defined      | Stop         | Note 2      |  |  |

Note 1: Low-Power Receivers (LP-Rx) of the lane pair will check the LP-00 state code when the Lane Pair is in the High Speed (HS) mode.

Note2: If Low-Power Receivers (LP-Rx) of the lane pair recognizes the LP-11 state code, then the lane pair will return to LP-11 of the Control Mode.

Note3: n = 0, 1, 2 and 3 (D1P/N, D2 P/N and D3 P/N lanes only for HS-0 and HS-1)

#### 5.1.2 DSI CLK Lanes

CLKP/N lanes can be driven into three different power modes: Low Power Mode (LPM), Ultra-Low Power Mode (ULPM) and High Speed Clock Mode (HSCM). Clock lane are in the single ended mode (LP = Low Power) when entering or leaving Low Power Mode (LPM) or Ultra-Low Power Mode (ULPM). Clock lane is in the single ended mode (LP = Low Power) when entering in or leaving High Speed Clock Mode (HSCM). These entering and leaving protocols use Clock lane in the single ended mode to generate an entering or leaving sequence. The principal flow chart of the different Clock lane power modes is illustrated below.

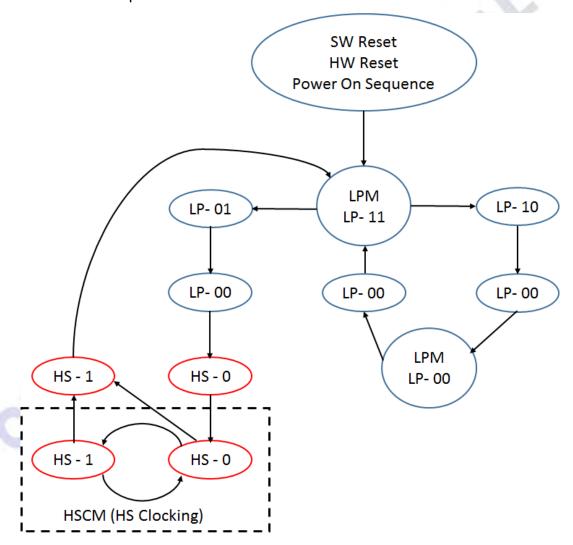

Figure 5.1.2-1: Clock Lane Power Modes

#### 5.1.3 Low Power Mode (LPM)

CLKP/N lanes can be driven to the Low Power Mode (LPM), when CLKP/N lanes enter LP-11 State Code, in three different ways:

- 1) After SW Reset, HW Reset or Power On Sequence => LP-11
- 2) After CLKP/N lanes leave Ultra-Low Power Mode (ULPM, LP-00 State Code) => LP-10 => LP-11 (LPM).

This sequence is illustrated below.

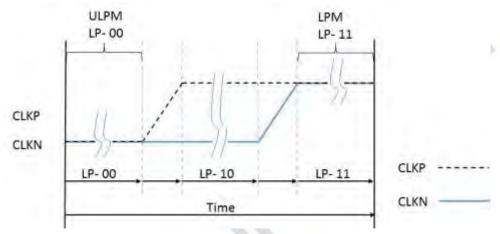

Figure 5.1.3-1: From ULPM to LPM

3) After CLKP/N lanes leave High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) => HS-0=> LP-11 (LPM).

This sequence is illustrated below.

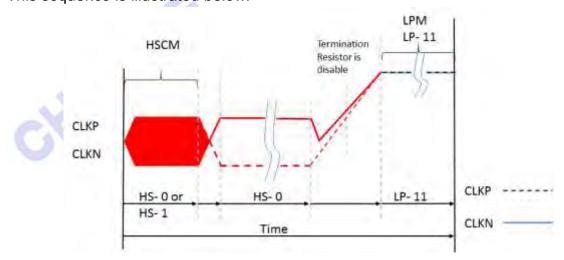

Figure 5.1.3-2: From High Speed Clock Mode (HSCM) to LPM

The changes of all the three modes are illustrated in the flow chart below.

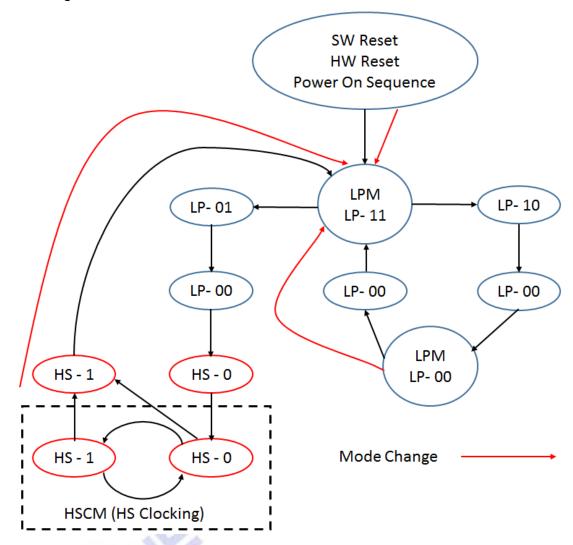

Figure 5.1.3-3: All Three Mode Changes to LPM

#### 5.1.4 Ultra- Low Power Mode (ULPM)

CLKP/N lanes can be driven to the Low Power Mode (LPM), when CLKP/N lanes enter LP-11 State Code, in three different ways:

- 1) After SW Reset, HW Reset or Power On Sequence => LP-11
- 2) After CLKP/N lanes leave Ultra-Low Power Mode (ULPM, LP-00 State Code) => LP-10 => LP-11 (LPM).

This sequence is illustrated below.

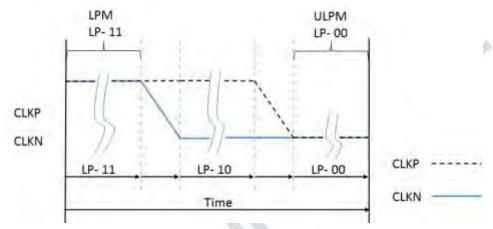

Figure 5.1.4-1: From LPM to ULPM

SHIP ONE

The mode change is also illustrated below.

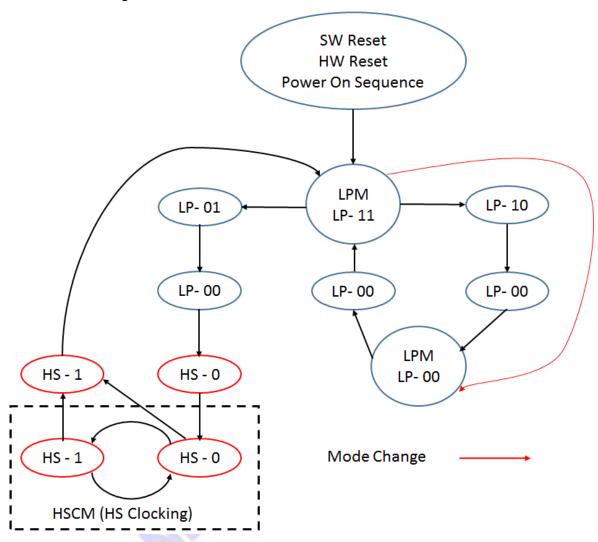

Figure 5.1.4-2: Mode Change from LPM to ULPM

## 5.1.5 High- Speed Clock Mode (HSCM)

CLKP/N lanes can be driven to the High Speed Clock Mode (HSCM) when CLK lanes start to function between HS-0 and HS-1 State Codes. The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) => LP-01 => LP-00 => HS-0 => HS-0/1 (HSCM).

This sequence is illustrated below.

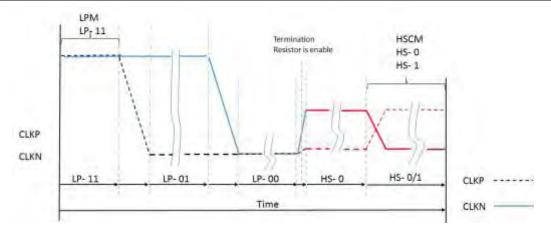

Figure 5.1.5-1: From LPM to HSCM

The mode change is also illustrated below.

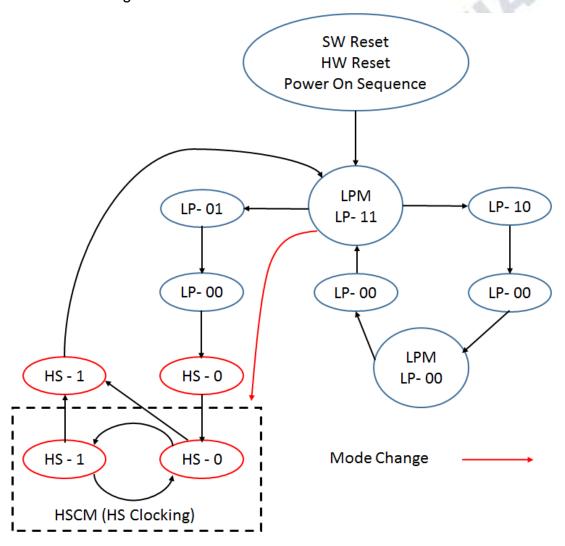

Figure 5.1.5-2: Mode Change from LPM to HSCM

The high speed clock (CLKP/N) starts before high speed data is sent via data lanes. The high speed clock continues clocking after the high speed data sending is stopped. The burst of the high speed clock consists of:

- Even number of transitions
- Start state is HS- 0
- End state is HS- 0

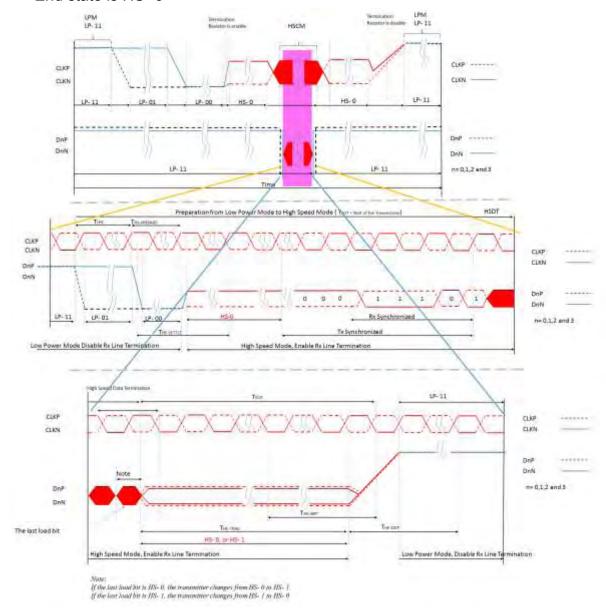

Figure 5.1.5-3: High Speed Clock Burst

### 5.2 Interface Level Communication - DSI Data Lane

### 5.2.1 General

D3P/N, D2P/N, D1P/N, and D0P/N Data lanes can be driven into different modes:

- Escape Mode (Only D0P/N data lane is used)
- High- Speed Data Transmission (all data lanes are used)
- Bus Turnaround Request (Only D0P/N data lane are used)

These modes and their entering codes are defined in the following table.

| Mode                          | Entering Mode Sequence                   | Leaving Mode<br>Sequence            |

### 5.2.2 Escape Modes

D0P/N data lanes can be used in different Escape Modes when data lanes are in the Low Power (LP) mode. These Escape Modes are used to:

- Send "Low-Power Data Transmission" (LPDT) from the MCU to the display module.
- Drive data lanes to "Ultra-Low Power State" (ULPS).
- Indicate "Remote Application Reset" (RAR), which can reset the display module.
   Indicate "Acknowledge" (ACK), which is used to transmit a non-error event from the display module to the MCU.

The basic sequence of the Escape Mode is as follows:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00
- Escape Command (EC), which is coded, when one of the data lanes changes from low-to-high-to-low then this changed data lane presents the value of the current data bit (D0P = 1, D0N= 0). When DSI-D0 changes from low-to-high-to-low, the receiver will latch a data bit, which value is logical 0. The receiver will use this low-to-high-to-low transition as its internal clock.
- A load if it is needed
- Exit Escape (Mark-1) LP-00 => LP-10 => LP-11
- End: LP-11

This basic construction is illustrated below:

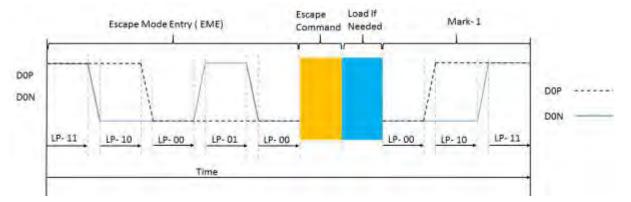

Figure 5.2.2-1: General Escape Mode Sequence

A total of eight Escape Commands (EC) are divided into two types: Mode and Trigger, as shown in below Table.

An example of the Mode type Escape Command is "Ultra-Low Power Mode", where the MCU instructs the display module to enter its Ultra-Low Power Mode. Escape commands are defined in the following table.

| Escape Command               | Command Type<br>Mode / Trigger | Entry command<br>Pattern<br>(First Bit→ Last Bit<br>Transmitted) | Dn | D0 |
|------------------------------|--------------------------------|--|----|----|
| Low- Power Data Transmission | Mode                           | 1110 0001 bin  |    | Х  |
| Ultra- Low Power Mode        | Mode                           | 0001 1110 bin  | х  | Х  |
| Underfined- 1, Note1         | Mode                           | 1001 1111 bin  |    |    |
| Underfined- 2, Note1         | Mode                           | 1101 1110 bin  |    |    |
| Remote Application Reset     | Trigger                        | 0110 0010 bin  |    | Х  |
| Acknowledge                  | Trigger                        | 0010 0001 bin  |    | Х  |
| UnKnow- 5, Note1             | Trigger                        | 1010 0000 bin  |    |    |

Note 1: This Escape command support is not implemented on the display module.

Note2: n=1

Note3: x= supported

### **5.2.3 Low- Power Data Transmission (LPDT)**

The MCU can send data to the display module in the Low-Power Data Transmission (LPDT) mode when data lanes enter the Escape Mode and Low-Power Data Transmission (LPDT) command is sent to the display module.

The display module also uses the same sequence when it sends data to the MCU. The Low Power Data

Transmission (LPDT) uses the following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00
- Low-Power Data Transmission (LPDT) command in the Escape Mode: 1110 0001 (first to last bit)
- Load (Data):
- One or more bytes (one byte = 8 bit)
- Data lanes are in pause mode when data lanes are stopped (both lanes are low) between bytes
- Mark-1: LP-00 => LP-10 => LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

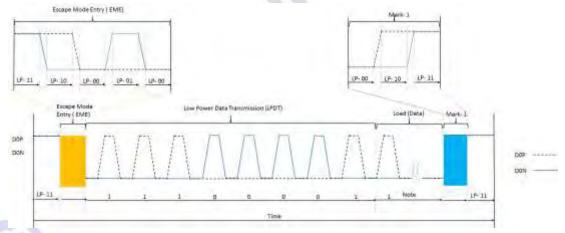

Figure 5.2.3-1: Low- Power Data Transmission (LPDT)

Note: Load (Data) presents that the first bit is the logical 1 in this example.

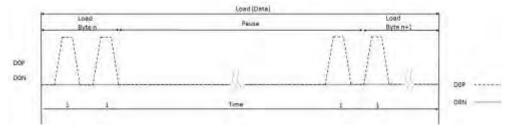

Figure 5.2.3-2: Pause (Example)

## 5.2.4 Ultra- Low Power State (ULPS)

The MCU can force data lanes get into the Ultra-Low Power State (ULPS) mode when data lanes enter the Escape Mode. The Ultra-Low Power State (ULPS) uses the following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00
- Ultra-Low Power State (ULPS) command in the Escape Mode: 0001 1110 (first to last bit)
- Ultra-Low Power State (ULPS) when the MCU keeps data lanes low
- Mark-1: LP-00 => LP-10 => LP-11
- End: LP-11 (Next command must wait 100us after data lanes leave ULPS)

This sequence is illustrated for reference purposes below:

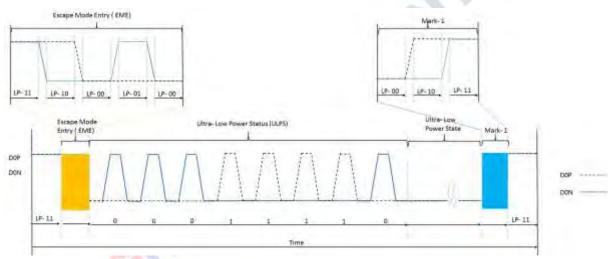

Figure 5.2.4-1: Ultra- Low Power State (ULPS)

## 5.2.5 Remote Application Reset (RAR)

The MCU can inform the display module that it should be reset in Remote Application Reset (RAR) trigger when data lanes enter the Escape Mode. The Remote Application Reset (RAR) uses the following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00
- Remote Application Reset (RAR) command in Escape Mode: 0110 0010 (first to last bit)
- Mark-1: LP-00 => LP-10 => LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

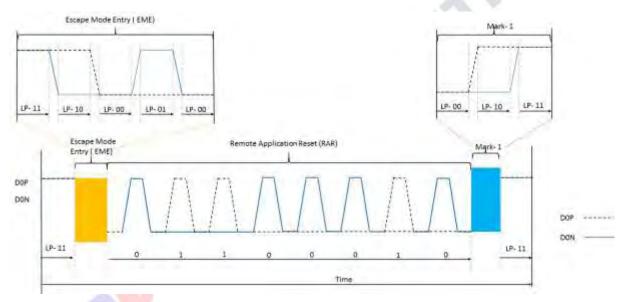

Figure 5.2.5-1: Remote Application Reset (RAR)

# 5.2.6 Acknowledge (ACK)

The display module can inform the MCU an error is not recognized by Acknowledge (ACK). The display module sends the Acknowledge (ACK) with the following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 => LP-10 => LP-00 => LP-01 => LP-00
- Acknowledge (ACK) command in the Escape Mode: 0010 0001 (first to last bit)
- Mark-1: LP-00 => LP-10 => LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

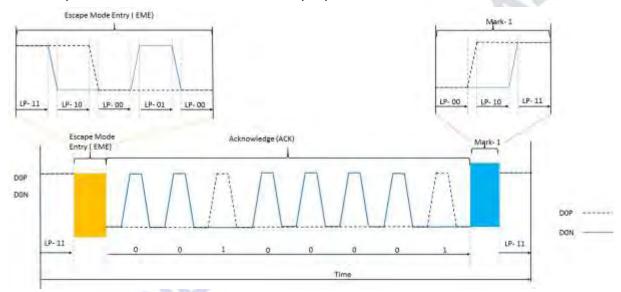

Figure 5.2.6-1: Acknowledge (ACK)

### 5.2.7 Entering High- Speed Data Transmission (TSOT of HSDT)

The display module enters High-Speed Data Transmission (HSDT) when Clock lane CLKP/N have already entered the High-Speed Clock Mode (HSCM) by the MCU. See more information in the section "High-Speed Clock Mode (HSCM)". Data lanes D3P/N, D2P/N, D1P/N and D0P/N of the display module enter the High-Speed Data Transmission (TSOT of HSDT) as follows:

- Start: LP-11
- HS-Request: LP-01
- HS-Settle: LP-00 => HS-0 (Rx: Lane Termination Enable)
- Rx Synchronization: 011101 (Tx (= MCU) Synchronization: 0001 1101)
- End: High-Speed Data Transmission (HSDT) Ready to receive High-Speed Data
   Load

The sequence of entering High-Speed Data Transmission (TSOT of HSDT) is illustrated below:

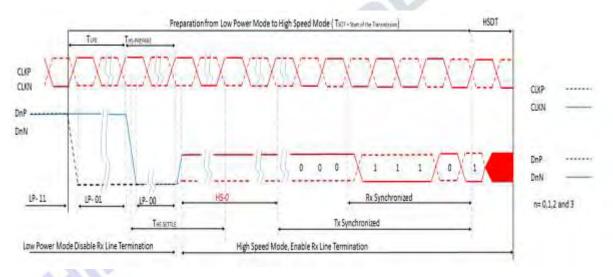

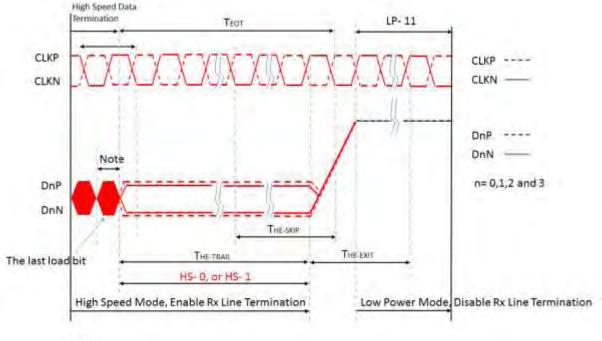

Figure 5.2.7-1: Entering High- Speed Data Transmission (TSOT of HSDT)

### 5.2.8 Leaving High- Speed Data Transmission (TEOP of HSDT)

The display module leaves the High-Speed Data Transmission (TEOT of HSDT) when Clock lane DSICLK+/- are in the High-Speed Clock Mode (HSCM) by the MCU, and this HSCM is kept until data lanes D3P/N, D2P/N, D1P/N and D0P/N are in the LP-11 mode. See more information in the section "High-Speed Clock Mode (HSCM)". Data lanes D3P/N, D2P/N, D1P/N and D0P/N of the display module leave the High-Speed Data Transmission (TEOT of HSDT) as follows:

- Start: High-Speed Data Transmission (HSDT)
- Stops High-Speed Data Transmission
- MCU changes to HS-1, if the last load bit is HS-0
- MCU changes to HS-0, if the last load bit is HS-1
- End: LP-11 (Rx: Lane Termination Disable)

The sequence of leaving High-Speed Data Transmission (TEOT of HSDT) is illustrated below:

Note: If the last load bit is HS- 0, the transmitter changes from HS- 0 to HS- 1. If the last load bit is HS- 1, the transmitter changes from HS- 1 to HS- 0

Figure 5.2.8-1: Leaving High- Speed Data Transmission (TEOT of HSDT)

## 5.2.9 Burst of the High- Speed Data Transmission (HSDT)

The burst of the "High-Speed Data Transmission" (HSDT) can consist of one or several data packet(s). These data packets can be Long (LPa) or Short (SPa) packets. These packets are defined in the section "Short Packet (SPa) and Long Packet (LPa) Structures". These different burst of the High-Speed Data Transmission (HSDT) cases are illustrated for reference purposes below.

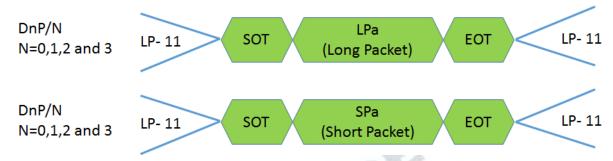

Figure 5.2.9-1: Single Packet in High-Speed Data Transmissions

The multiple packets in High-Speed Data Transmission are illustrated for reference purposes below:

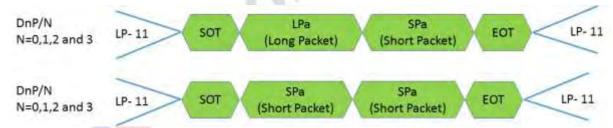

Figure 5.2.9-2: Multiple Packets in High- Speed Data Transmission – Example

| Abbreviation | Explanation   |
|--------------|---|
| EOT          | End of the Transmission                                 |
| LPa          | Long Packet   |
| LP-11        | Low Power Mode, Both of Data lanes are "1"s (Stop Mode) |
| SPa          | Short Packet  |
| SOT          | Start of the Transmission                               |

## 5.2.10 Bus Turnaround (BTA)

The MCU or display module, which controls D0P/N Data Lanes, can start a bus turnaround procedure when it requires information from a receiver, which can be the MCU or display module. The MCU and display module use the same sequence when this bus turnaround procedure is used. The sequence, when the MCU wants to do the bus turnaround procedure to the display module, is described for reference purposes as follows:

- Start (MCU): LP-11
- Turnaround Request (MCU): LP-11 => LP-10 => LP-00 => LP-10 => LP-00
- The MCU waits until the display module starts to control D0P/N data lanes and the MCU stops to control D0P/N data lanes (= High-Z)
- The display module changes to the stop mode: LP-00 => LP-10 => LP-11 The bus turnaround procedure (from the MCU to the display module) is illustrated below:

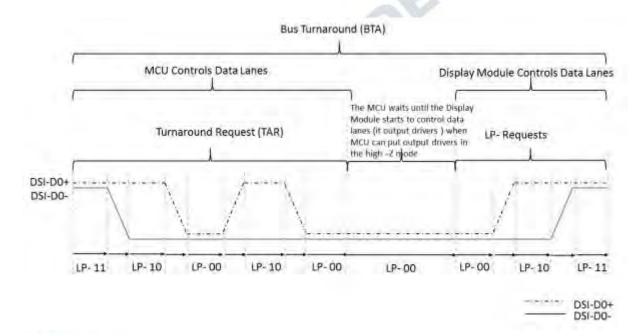

Figure 5.2.10-1: Bus Turnaround Procedure

MCU and display module terms can be switched in Figure 5.2.10-1 if the Bus Turnaround (BTA) is from the display module to the MCU.

### 5.3 Packet Level Communication

### 5.3.1 Short Packet (SPa) and Long Packet (LPa) Structures

Short Packet (SPa) and Long Packet (LPa) are always used when data transmission is done in Low Power Data Transmission (LPDT) or High-Speed Data Transmission (HSDT) modes. The lengths of the packets are:

- Short Packet (SPa): 4 bytes
- Long Packet (LPa): 6 to 65,541 bytes

The type (SPa or LPa) of the packet can be recognized from their package headers (PH).

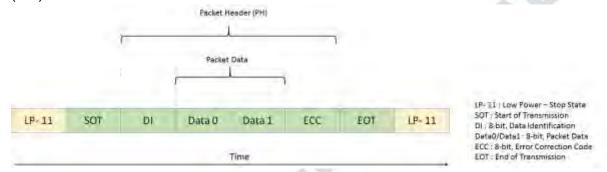

Figure 5.3.1-1: Short Packet (SPa) Structure

Figure 5.3.1-2: Long Packet (LPa) Structure

#### Notes:

- 1. Figure 5.4.1-1 and Figure 5.4.1-2 present a single packet sending (= Includes LP-11, SoT and EoT for each packet sending).
- 2. The other possibility is that SoT, EoT and LP-11 are not needed between packets if packets are sent in multiple packet format, e.g.

```
LP-11 => SoT => SPa => LPa => SPa => EoT => LP-11

LP-11 => SoT => SPa => SPa => EoT => LP-11

LP-11 => SoT => LPa => LPa => LPa => EoT => LP-11
```

## **5.3.2 Bit Order of the Byte on Packet**

The bit order of the byte, what is used in packets, is that the Least Significant Bit (LSB) of the byte is sent first, and the Most Significant Bit (MSB) is sent last. The order is illustrated for reference purposes below.

# 5.3.3 Byte Order of the Multiple Byte Information on Packets

Byte order of the multiple bytes information, what is used in packets, is that the Least Significant (LS) Byte of the information is sent first and the Most Significant (MS) Byte is sent last. For example, Word Count (WC) consists of 2 bytes (= 16 bits); while the LS byte is sent first and the MS byte is sent last. The order is illustrated for reference purposes below.

## 5.3.4 Packet Header (PH)

The packet header always consists of 4 bytes. The content of these 4 bytes are different for Short Packet (SPa) and Long Packet (LPa).

- Short Packet (SPa)
- 1st byte: Data Identification (DI) => Identify that this is a Short Packet (SPa)
- 2nd and 3rd bytes: Packet Data (PD), Data 0 and 1
- 4th byte: Error Correction Code (ECC)

# 5.3.5 Data Identification (DI)

Data Identification (DI) is a part of the Packet Header (PH), and it consists of 2 parts:

- Virtual Channel (VC), 2 bits, DI [7...6]
- Data Type (DT), 6 bits, DI [5...0]

The Data Identification (DI) structure is illustrated, see the figure below.

Figure 5.3.6-1: Virtual Channel (VC) on the Packet Header (PH)

Virtual Channel (VC) can assign 4 different channels for 4 different display modules. Devices will use the same virtual channel as which the MCU uses to send packets to them, e.g.

- The MCU uses the virtual channel 0 when it sends packets to the ICNL9706.
- The ICNL9706 also uses the virtual channel 0 when it sends packets to the MCU

This functionality is illustrated below.

Virtual Channel (VC) is always 0 (DI [7:6] = VC [1:0] = 00b) when the MCU sends "End of Transmission Packet" to the display module. See the section "End of Transmission Packet (EoTP)". This display module does not support the virtual channel selector for other devices (1 to 3) when the only possible virtual channel (VC [1:0]) is 00b for the ICNL9706.

# 5.3.7 Data Type (DT)

Data Type (DT) is a part of Data Identification (DI [5...0]) structure, and it is used to define the type of the used data in a packet. Bits of the Data Type (DT) are illustrated for reference purposes below.

#### Notes:

- 1. This can be used when the MCU wants to make sure that it is the end of the transmission in High Speed Data Transferring (HSDT) mode.
- 2. This can be used when data lanes are to be kept in High Speed Data Transferring (HSDT) Mode.

Data Type (DT) from the Display Module (or Other Devices) to the MCU

The receiver will ignore other Data Type (DT) if they are not defined on tables: "Data Type (DT) from the MCU to the Display Module (or Other Devices)" or "Data Type (DT) from the Display Module (or Other Devices) to the MCU".

Note: The data type for Generic write/read: 1Ah, 11h, 12 will be disable (ignored packet) if bit DSIG is set to "0".

# 5.3.8 Packet Data (PD) in a Short Packet (SPa)

Packet Data (PD) of the Short Packet (SPa) is placed after Data Type (DT) of the Data Identification (DI) and indicates a Short Packet (SPa) is to be sent. Packet Data (PD) of a Short Packet (SPa) consists of 2 data bytes: Data 0 and Data 1. The sending order of the Packet Data (PD) is that Data 0 is sent first and the Data 1 is sent last. Bits of Data 1 are set to 0 if the information length is 1 byte. Packet Data (PD) of a Short Packet (SPa), when the length of the information is 1 or 2 bytes and Virtual Channel (VC) is 0, are illustrated for reference purposes below.

- Packet Data (PD) information:
- Data 0: 26Hex (Display Command Set (DCS) with 1 Parameter => DI (Data Type (DT)) = 15Hex)
- Data 1: 01Hex (DCS's Parameter)

# 5.3.9 Word Count (WC) in a Long Packet (LPa)

Word Count (WC) of the Long Packet (LPa) is placed after Data Type (DT) of the Data Identification (DI) and indicates that a Long Packet (LPa) is to be sent. Word Count (WC) indicates the amount of data bytes of the Packet Data (PD) that is to be sent after the Packet Header (PH). The location of the Word Count (WC) in a Long Packet is the same as which of the Packet Data (PD) in a Short Packet (SPa), as shown in Figure 5.4.9-2. Word Count (WC) of the Long Packet (LPa) consists of 2 bytes. The sending order of these 2 bytes of the Word Count (WC) is that the Least Significant (LS) Byte is sent first, and the Most Significant (MS) Byte is sent last. Word Count (WC) of a Long Packet (LPa) is illustrated for reference purposes below.

### 5.3.10 Error Correction Code (ECC)

The Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors.

The ECC protects the following fields:

- Short Packet (SPa): Data Identification (DI) byte (8 bits: D [0...7]), Packet Data (PD) bytes (16 bits: D [8...23]) and ECC (8 bits: P [0...7])
- Long Packet (LPa): Data Identification (DI) byte (8 bits: D [0...7]), Word Count (WC) bytes (16 bits: D [8...23]) and ECC (8 bits: P [0...7]) D [23...0] and P [7...0] are illustrated for reference purposes below.

Error Correction Code (ECC) can recognize one or several error(s) and can only correct one-bit error. Bits (P [7...0]) of the Error Correction Code (ECC) are defined, where the symbol "^" presents the XOR function (Pn is 1 if there is odd number of 1, and Pn is 0 if there is even number of 1), as follows.

Version: 0.7 2017-10

- P7 = 0
- P6 = 0
- P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23
- P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23
- P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23
- P2 = D0^D2^D3^D5^D6^D9^D11^D12^D15^D18^D20^D21^D22
- P1 = D0^D1^D3^D4^D6^D8^D10^D12^D14^D17^D20^D21^D22^D23
- P0 = D0^D1^D2^D4^D5^D7^D10^D11^D13^D16^D20^D21^D22^D23

P7 and P6 are set to 0 because Error Correction Code (ECC) is based on 64 bit value (D [63...0]), but this implementation is based on 24 bit value (D [23...0]). Therefore, only 6 bits are needed (P [5...0]) for Error Correction Code (ECC).

Figure 5.3.10-4: XOR Function on Long Packet (LPa)

Time

The transmitter (= the MCU or the Display Module) will send data bits D [23...0] and Error Correction Code (ECC) P [7...0]. The receiver (= the Display module or the MCU) will calculate the Internal Error Correction Code (IECC) and compare the received Error Correction Code (ECC) and the Internal Error Correction Code (IECC). This comparison is done when each power bit of ECC and IECC have performed the XOR function. The result of this function is PO [7...0]. This functionality, where the transmitter is the MCU and the receiver is the display module, is illustrated for reference purposes below.

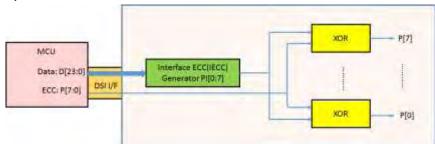

Figure 5.3.10-5: Internal Error Correction Code (IECC) on the Display Module (= the Receiver)

The sent data bits (D [23...0]) and ECC (P [7...0]) are correctly received if the value of the PO [7...0]) is 00h.

The sent data bits (D [23...0]) and ECC (P [7...0]) are not correctly received if the value of the PO [7...0]) is not 00h.

The received Error Correction Code (ECC) can be 00h when the Error Correction Code (ECC) function is not used for data values D [23...0] on the transmitter side. The number of the errors (one or more) can be defined when the value of the PO [7...0] is compared to the values in the following table.

An error is detected if the value of the PO [7...0] is in Table, and the receiver can correct this one bit error because this found value also defines the location of the corrupt bit, e.g.

- PO [7...0] = 0Eh
- The bit of the data (D [23...0]), that is not correct, is D [3] More than one error is detected if the value of the PO [7...0] is not in Table for example, PO [7...0] = 0Ch.

### 5.3.11 Packet Data (PD) in a Long Packet (LPa)

Packet Data (PD) of a Long Packet (LPa) is placed after the Packet Header (PH) of a Long Packet (LPa). The amount of the data bytes is defined in the section "Word Count (WC) in a Long Packet (LPa)".

### 5.3.12 Packet Footer (PF) in a Long Packet (LPa)

Packet Footer (PF) of a Long Packet (LPa) is placed after the Packet Data (PD) of a Long Packet (LPa). The Packet Footer (PF) is a checksum value that is calculated from the Packet Data of the Long Packet (LPa). The checksum uses a 16-bit Cyclic Redundancy Check (CRC) value which is generated by a polynomial X16+X12+X5+X0, as illustrated below.

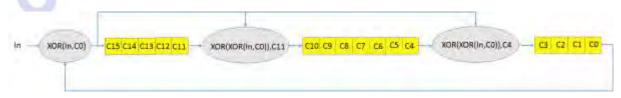

Figure 5.3.12-1: 16-bit Cyclic Redundancy Check (CRC) Calculation

The 16-bit Cyclic Redundancy Check (CRC) generator is initialized to FFFFh before calculations. The Most Significant Bit (MSB) of the data byte of the Packet Data (PD) is the first bit which is inputted into the 16-bit Cyclic Redundancy Check (CRC). An example of the 16-bit Cyclic Redundancy Check (CRC), where the Packet Data (PD)

of a Long Packet (LPa) is 01h, is illustrated (step-by-step) below.

Figure 5.3.12-2: CRC Calculation - Packet Data (PD) is 01h

The value of the Packet Footer (PF) is 1E0Eh in this example (Command 01h has been sent), and is illustrated below

Figure 5.3.12-3: Packet Footer (PF) Example

Time

The receiver calculates its checksum value from the received Packet Data (PD). The receiver compares its checksum and the Packet Footer (PF) that the transmitter has sent. The received Packet Data (PD) and Packet Footer (PF) are correct if the checksum of the receiver and Packet Footer (PF) are equal. The received Packet Data (PD) and Packet Footer (PF) are not correct if the checksum of the receiver and Packet Footer (PF) are not equal.

### 5.4 Packet Transmissions

# 5.4.1 Display Command Set (DCS)

Display Command Set (DCS), defined in the section "Level1 Command Description", is used from the MCU to the display module. This Display Command Set (DCS) is always defined in the Data 0 of the Packet Data (PD), and is included in Short Packet (SPa) and Long packet (LPa), as illustrated below.

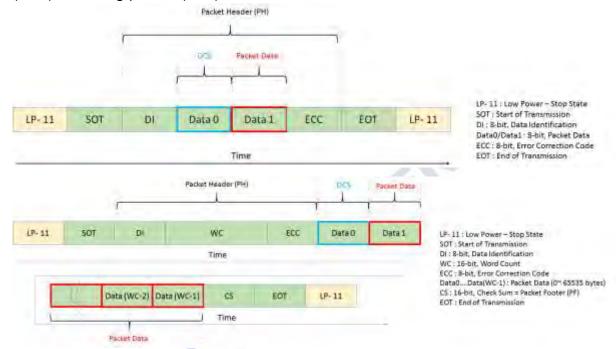

Figure 5.4.1-1: Display Command Set (DCS) in Short Packet (SPa) and Long Packet (LPa)

## 5.4.2 Display Command Set (DCS) Write, No Parameter (DSCWN-S)

"Display Command Set (DCS) Write, No Parameter", which is defined in Data Type (DT, 00 0101b), is always used in a Short Packet (SPa) from the MCU to the display module. These commands are defined in a table below.

| Command                       |      |
|-------------------------------|------|
| NOP (00h)                     |      |
| Software Reset (01h)          |      |
| Sleep In (10h)                |      |
| Sleep Out (11h)               |      |
| Normal Display Mode On (13h)  |      |
| INVOff (20h)                  |      |
| INVOn (21h)                   |      |
| All Pixel Off (22h)           | - 27 |
| All Pixel On (23h)            | 1    |
| Display Off (28h)             | 1. 1 |

| Idle Mode Off (38h)           |      |
| Idle Mode On (39h)            |      |

A Short Packet (SPa) is defined as:

- Data Identification (DI)
  - Virtual Channel (VC, DI [7...6]): 00b
  - Data Type (DT, DI [5...0]): 00 0101b
- Packet Data (PD)
  - Data 0: "Sleep In (10h)", Display Command Set (DCS)

#### Notes:

- 1. Also Short Packet (SPa) can be used; See Display Command Set (DCS) Write, No Parameter.
- 2. Also Short Packet (SPa) can be used; See Display Command Set (DCS) Write, 1 Parameter.

Long Packet (LPa), when a command (No Parameter) was sent, is defined e.g.

- Data Identification (DI)
  - Virtual Channel (VC, DI[7...6]): 00b
  - Data Type (DT, DI[5...0]): 11 1001b
- Word Count (WC)
  - Word Count (WC): 0001h
- Error Correction Code (ECC)
- Packet Data (PD): Data 0: "Sleep In (10h)", Display Command Set (DCS)
- Packet Footer (PF)

This is defined on the Short Packet (SPa) as follows.

Figure 5.4.4-1: Display Command Set (DCS) Write, Long (DCSWL-S) with DCS Only- Example

A Long Packet (LPa) with one Write (1 parameter) is defined as:

- Data Identification (DI)
  - Virtual Channel (VC, DI [7...6]): 00b
  - Data Type (DT, DI [5...0]): 11 1001b
- Word Count (WC)
  - Word Count (WC): 0002h
- Error Correction Code (ECC)
- Packet Data (PD):
  - Data 0: "Gamma Set (26h)", Display Command Set (DCS)
  - Data 1: 01hex, Parameter of the DCS
- Packet Footer (PF)

## 5.4.5 Display Command Set (DCS) Read, No Parameter (DCSRN-S)

"Display Command Set (DCS) Read, No Parameter" (DCSRN-S), which is defined in Data Type (DT, 00 0110b), is always used in a Short Packet (SPa) from the MCU to the display module. These commands are defined in the table below.

| Command         |       |
|-----------------|-------|
| RDDID (04h)     |       |
| RDDPM (0Ah)     |       |
| RDDMADCTR (0Bh) |       |
| RDDCOLMOD (0Ch) |       |
| RDDIM (0Dh)     |       |
| RDDSM (0Eh)     | A Day |
| RDDSDR (0Fh)    | 7/1/  |
| GSL (45h)       | 4     |
| RDDISBV (52h)   |       |
| RDCTRLD (54h)   |       |
| RDCABC (56h)    |       |
| RDCABCMB (5Fh)  |       |
| RDID1 (DAh)     |       |
| RDID2 (DBh)     |       |
| RDID3 (DCh)     |       |

The MCU has to define to the display module the maximum size of the returned packet. The command, which is used for this purpose, is "Set Maximum Return Packet Size" (SMRPS-S), which Data Type (DT) is 11 0111b and is used in a Short Packet (SPa) before the MCU can send "Display Command Set (DCS) Read, No Parameter" to the display module. This sequence is illustrated for reference purposes below.

Step1

The MCU sends "Set Maximum Return Packet Size" (Short Packet (SPa)) (SMRPS-S) to the display module when it wants to return one byte from the display module.

### - Step 3

The display module can send 2 different information to the MCU after Bus Turnaround (BTA):

- 1. An acknowledge with Error Report (AwER), which is used in a Short Packet (SPa), if there is an error when receiving a command. See the section "Acknowledge with Error Report (AwER)".
- Information of the received command, which can be a Short Packet (SPa) or a Long Packet (LPa).

## 5.4.6 Null Packet, No Data (NP-L)

"Null Packet, No Data" (NP-L), which is defined in Data Type (DT, 001001b), is always used in a Long Packet (LPa) from the MCU to the display module. The purpose of this command is to keep data lanes in the high speed mode (HSDT) if necessary. The display module can ignore the Packet Data (PD) that the MCU sends.

A Long Packet (LPa) with 5 random data bytes of the Packet Data (PD) is defined as:

- Data Identification (DI)
  - Virtual Channel (VC, DI [7...6]): 00b
  - Data Type (DT, DI [5...0]): 00 1001b
- Word Count (WC)
  - Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
  - Data 0: 89hex (Random data)
  - Data 1: 23hex (Random data)
  - Data 2: 12hex (Random data)
  - Data 3: A2hex (Random data)
  - Data 4: E2hex (Random data)

# **5.4.7 End of Transmission Packet (EoTP)**

"End of Transmission Packet" (EoTP), which is an interface level function and defined in Data Type (DT, 00 1000b), is always used in a Short Packet (SPa) from the MCU to the display module. The purpose of this command is to terminate the high Speed Data Transmission (HSDT) mode properly when EoTP is added after the last payload packet before "End of Transmission" (EoT). The MCU can decide if it wants to use the "End of Transmission Packet" (EoTP) or not. The display shall have the capability to support both. That is, if the MCU applies the EoTP, it shall report the "DSI Protocol Violation Error" when the EoTP is not detected in the High-Speed (HS). The display module error reporting shall be enabled/disabled statistically, according to the module application. The display module does or does not receive "End of Transmission (LPDT) mode before "Mark-1" (= leaving the Escape mode) which ends the Low Power Data Transmission (LPDT) mode. The display module is not allowed to send "End of Transmission Packet" (EoTP) to the MCU during the Low Power Data Transmission (LPDT) mode. The summary of the receiving and transmitting EoTP is listed below.

#### 5.4.8 Acknowledge with Error Report (AwER)

"Acknowledge with Error Report" (AwER), which is defined in Data Type (DT, 00 0010b), is always used in a Short Packet (SPa) from the display module to the MCU. The Packet Data (PD) can include bits, which define the current error, when the corresponding bit is set to 1, as defined in the following table.

| Bit | Description                                    |
|-----|--|
| 0   | SoT Error                                      |
| 1   | SoT Sync Error                                 |
| 2   | EoT Sync Error                                 |
| 3   | Escape Mode Entry Command Error                |
| 4   | Low-Power Transmit Sync Error                  |
| 5   | Any Protocol Timer Time-Out                    |
| 6   | False Control Error                            |
| 7   | Contention is Detected on the Display Module   |
| 8   | ECC Error, single-bit (detected and corrected) |
| 9   | ECC Error, multi-bit (detected, not corrected) |
| 10  | Checksum Error (Long Packet only)              |
| 11  | DSI Data Type (DT) Not Recognized              |
| 12  | DSI Virtual Channel (VC) ID Invalid            |
| 13  | Invalid Transmission Length                    |
| 14  | Reserved, Set to 0 internally                  |
| 15  | DSI Protocol Violation                         |

These errors are included in all packages that have been received from the MCU to the display module before the Bus Turnaround (BTA). The display module ignores the received packet which includes error or errors.

Acknowledge with Error Report (AwER) of a Short Packet (SPa) is defined as:

- Data Identification (DI)
  - Virtual Channel (VC, DI [7...6]): 00b
  - Data Type (DT, DI [5...0]): 00 0010b
- Packet Data (PD)
  - Bit 8: ECC Error, single-bit (detected and corrected)
  - AwER: 0100h
- Error Correction Code (ECC)

Figure 5.4.8-1: Acknowledge with Error Report (AwER) – Example

It is possible that the display module receives several packets, which include errors, from the MCU before the MCU performs the Bus Turnaround (BTA). Some examples are illustrated for reference purposes below.

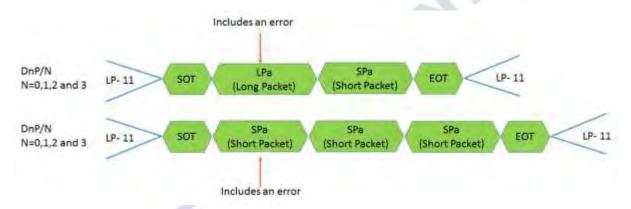

Figure 5.4.8-2: Error Packets

Therefore, a method is needed to check if there are errors in the previous packets. These errors of the previous packets can be detected by "Read Display Signal Mode (0Eh)" and "Read Number of the Errors on DSI (05h)" commands. The bit D0 of the "Read Display Signal Mode (0Eh)" command will be set to 1 if a received packet includes an error. The amount of packets, which include an *ECC or CRC* error, is calculated in the RDNUMED register, which can read "Read Number of the Errors on DSI (05h)" command. This command also sets the RDNUMED register to 00h and set the bit D0 of the "Read Display Signal Mode (0Eh)" command to 0 after the MCU has read the RDNUMED register from the display module. The functionality of the RDNUMED register is illustrated for reference purposes below.

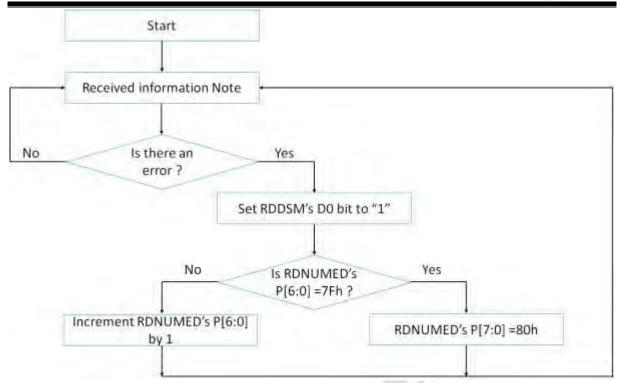

Figure 5.4.8-2: Flow Chart for Errors on DSI

#### Notes:

- 1. This information can be Interface or Packet Level Communication, but it is always from the MCU to the display module.
- 2. CRC or ECC error

### 5.4.9 DCS Read Long Response (DCSRR-L)

"DCS Read Long Response" (DCSRR-L), which is defined in Data Type (DT, 011100b), is always used in a Long Packet (LPa) from the display module to the MCU. "DCS Read Long Response" (DCSRR-L) is used when the display module wants to respond to a DCS Read command, which the MCU has sent to the display module. A Long Packet (LPa), which includes 5 data bytes of the Packet Data (PD), is defined as:

- Data Identification (DI)
- Virtual Channel (VC, DI [7...6]): 00b
- Data Type (DT, DI [5...0]): 01 1100b
- Word Count (WC)
- Word Count (WC): 0005hex
- Error Correction Code (ECC)
- Packet Data (PD):
- Data 0: 89hex
- Data 1: 23hex
- Data 2: 12hex
- Data 3: A2hex
- Data 4: E2hex
- Packet Footer (PF)

### 5.4.10 DCS Read Short Response, 1 Byte Returned (DCSRR1-S)

"DCS Read Short Response, 1 Byte Returned" (DCSRR1-S), which is defined in Data Type (DT, 10 0001b), is always used in a Short Packet (SPa) from the display module to the MCU. "DCS Read Short Response, 1 Byte Returned (DCSRR1-S) is used when the display module wants to respond to a DCS Read command, which the MCU has sent to the display module.

A Short Packet (SPa) is defined as:

- Data Identification (DI)
- Virtual Channel (VC, DI [7...6]): 00b
- Data Type (DT, DI [5...0]): 10 0001b
- Packet Data (PD)
- Data 0: 45hex
- Data 1: 00hex (Always)
- Error Correction Code (ECC)

Figure 5.4.10-1: DCS Read Short Response, 1Byte Return (DCSRR1-S) - Example

### 5.4.11 DCS Read Short Response, 2 Byte Returned (DCSRR2-S)

"DCS Read Short Response, 2 Bytes Returned" (DCSRR2-S), which is defined in Data Type (DT, 10 0010b), is always used in a Short Packet (SPa) from the display module to the MCU. "DCS Read Short Response, 2 Bytes Returned" (DCSRR2-S) is used when the display module wants to respond to a DCS Read command, which the MCU has sent to the display module.

A Short Packet (SPa) is defined as:

- Data Identification (DI)
- Virtual Channel (VC, DI [7...6]): 00b
- Data Type (DT, DI [5...0]): 10 0010b
- Packet Data (PD)
- Data 0: 45hex
- Data 1: 32hex
- Error Correction Code (ECC)

## 5.5. Communication Sequences

#### 5.5.1 General

The communication sequences can be done on interface or packet levels between the MCU and the display module. See sections "Interface Level Communication" and "Packet Level Communication". This communication sequence description is for DSI data lanes (D3P/N, D2P/N, D1P/N and D0P/N), and it is assumed that the needed low level communication is done on DSI Clock lane (CLKP/N) automatically. See the section "DSI CLK Lanes". Functions of the interface level communication are described in the following table.

5.5.1 Table 1: Interface Level Communication

| Interface Mode | Abbreviation | Interface Action Description         |
|----------------|--------------|--------------------------------------|

#### 5.6 Video Mode Communication

Video Mode peripherals require pixel data delivered in real time. This section specifies the format and timing of DSI traffic for this type of display module.

#### 5.6.1 Transmission Packet Sequences

DSI supports several formats, or packet sequences, for Video Mode data transmission. The peripheral's timing requirements dictate which format is appropriate. In the following sections, *Burst Mode* refers to time-compression of the RGB pixel (active video) portion of the transmission. In addition, these terms are used throughout the following sections:

- Non-Burst Mode with Sync Pulses enables the peripheral to accurately reconstruct original video timing, including sync pulse widths.
- Non-Burst Mode with Sync Events similar to above, but accurate reconstruction
  of sync pulse widths is not required, so a single Sync Event is substituted.
- Burst mode RGB pixel packets are time-compressed, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link.

In the following figures the Blanking or Low-Power Interval (BLLP) is defined as a period during which video packets such as pixel-stream and sync event packets are not actively transmitted to the peripheral. To enable PHY synchronization the host processor should periodically end HS transmission and drive the Data Lanes to the LP state. This transition should take place at least once per frame; shown as LPM in the figures in this section. It is recommended to return to LP state once per scan-line during the horizontal blanking time. Regardless of the frequency of BLLP periods, the host processor is responsible for meeting all documented peripheral timing requirements. Note, at lower frequencies BLLP periods will approach, or become, zero, and burst mode will be indistinguishable from non-burst mode.

During the BLLP the DSI Link may do any of the following:

- Remain in Idle Mode with the host processor in LP-11 state and the peripheral in LP-RX
- Transmit one or more non-video packets from the host processor to the peripheral using Escape Mode
- Transmit one or more non-video packets from the host processor to the peripheral using HS Mode
- If the previous processor-to-peripheral transmission ended with BTA, transmit one or more packets from the peripheral to the host processor using Escape Mode
- Transmit one or more packets from the host processor to a different peripheral using a different Virtual Channel ID

The sequence of packets within the BLLP or RGB portion of a HS transmission is arbitrary. The host processor may compose any sequence of packets, including iterations, within the limits of the packet format definitions. For all timing cases, the

first line of a frame shall start with VS; all other lines shall start with HS. This is also true in the special case when VSA+VBP=0. Note that the position of synchronization packets, such as VS and HS, in time is of utmost importance since this has a direct impact on the visual performance of the display panel.

Normally, RGB pixel data is sent with one full scan line of pixels in a single packet. If necessary, a horizontal scan-line of active pixels may be divided into two or more packets. However, individual pixels shall not be split across packets.

Transmission packet components used in the figures in this section are defined in Figure below unless otherwise specified.

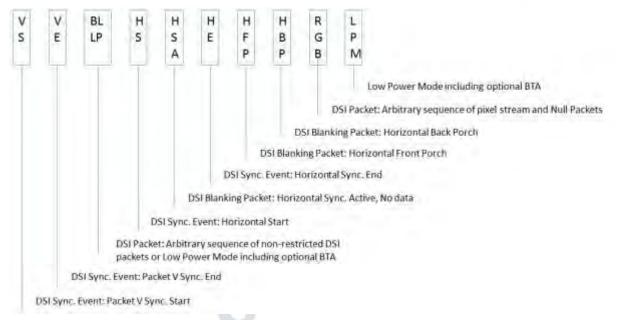

Figure 5.6.1-1: DSI Video Mode Interface Timing Legend

If a peripheral timing specification for HBP or HFP minimum period is zero, the corresponding Blanking Packet may be omitted. If the HBP or HFP maximum period is zero, the corresponding blanking packet shall be omitted.

#### 5.6.2 Non-Burst Mode with Sync Pulses

With this format, the goal is to accurately convey DPI-type timing over the DSI serial Link. This includes matching DPI pixel-transmission rates, and widths of timing events like sync pulses. Accordingly, synchronization periods are defined using packets transmitting both start and end of sync pulses. An example of this mode is shown in Figure below.

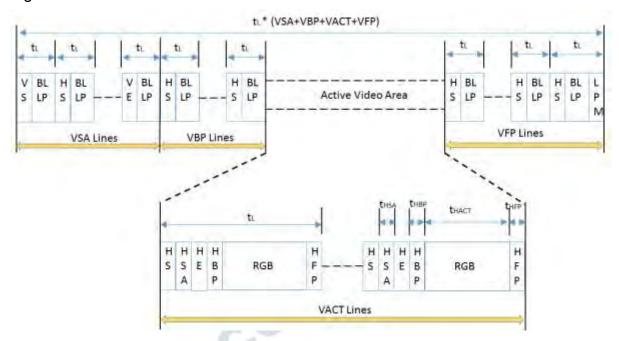

Figure 5.6.2-1: DSI Video Mode Interface Timing: Non-Burst Transmission with Sync Start and End

Normally, periods shown as HSA (Horizontal Sync Active), HBP (Horizontal Back Porch) and HFP (Horizontal Front Porch) are filled by Blanking Packets, with lengths (including packet overhead) calculated to match the period specified by the peripheral's data sheet. Alternatively, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

#### 5.6.3 Burst Mode

In this mode, blocks of pixel data can be transferred in a shorter time using a time-compressed burst format. This is a good strategy to reduce overall DSI power consumption, as well as enabling larger blocks of time for other data transmissions over the Link in either direction. There may be a line buffer or similar memory on the peripheral to accommodate incoming data at high speed. Following HS pixel data transmission, the bus goes to Low Power Mode, during which it may remain idle, i.e. the host processor remains in LP-11 state, or LP transmission may take place in either direction. If the peripheral takes control of the bus for sending data to the host processor, its transmission time shall be limited to ensure data underflow does not occur from its internal buffer memory to the display device. An example of this mode is shown in Figure below.

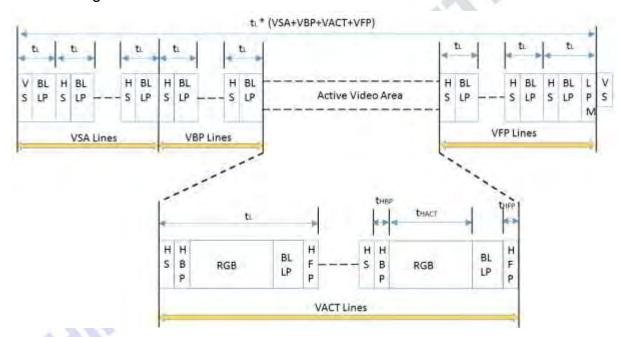

Figure 5.6.2-1: DSI Video Mode Interface Timing: Burst Transmission

Similar to the Non-Burst Mode scenario, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

## 5.7 Display Data Format

#### 5.7.1 16-bit per Pixel, Long Packet, Data Type 001110 (0Eh)

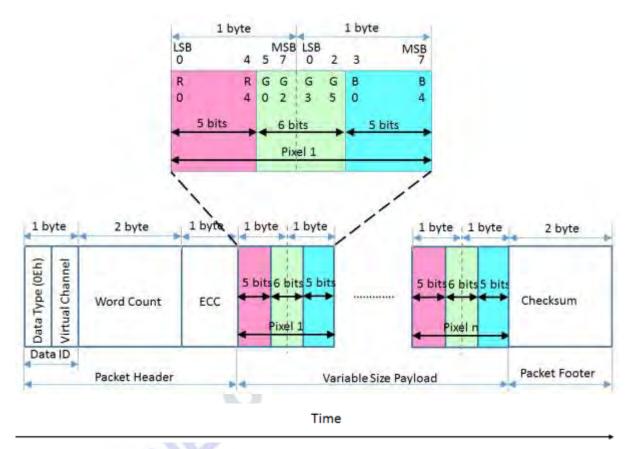

Figure 5.7.1-1: 16-bit per Pixel - RGB Color Format, Long Packet

Packed Pixel Stream 16-Bit Format is a Long packet used to transmit image data formatted as 16-bit pixels to a Video Mode display module. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte checksum. Pixel format is five bits red, six bits green, five bits blue, in that order. Note that the "Green" component is split across two bytes. Within a color component, the LSB is sent first, the MSB last. With this format, pixel boundaries align with byte boundaries every two bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of two bytes.

Normally, the display module has no frame buffer of its own, so all image data shall be supplied by the host processor at a sufficiently high rate to avoid flicker or other visible artifacts.

## 5.7.2 18-bit per Pixel, Long Packet, Data Type 011110 (1Eh)

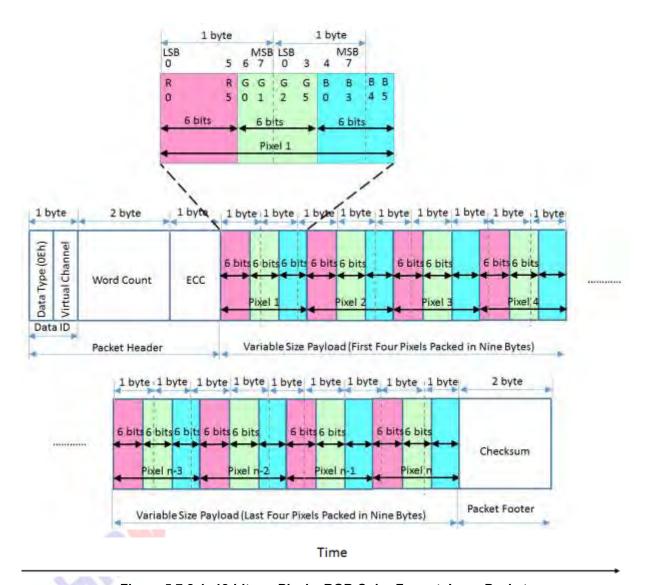

Figure 5.7.2-1: 18-bit per Pixel – RGB Color Format, Long Packet

Packed Pixel Stream 18-Bit Format (Packed) is a Long packet. It is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. Pixel format is red (6 bits), green (6 bits) and blue (6 bits), in that order. Within a color component, the LSB is sent first, the MSB last. Note that pixel boundaries only align with byte boundaries every four pixels (nine bytes). Preferably, display modules employing this format have a horizontal extent (width in pixels) evenly divisible by four, so no partial bytes remain at the end of the display line data. If the active (displayed) horizontal width is not a multiple of four pixels, the transmitter shall send additional fill pixels at the end of the

display line to make the transmitted width a multiple of four pixels. The receiving peripheral shall not display the fill pixels when refreshing the display device. For example, if a display device has an active display width of 399 pixels, the transmitter should send 400 pixels in one or more packets. The receiver should display the first 399 pixels and discard the last pixel of the transmission. With this format, the total line width (displayed plus non-displayed pixels) should be a multiple of four pixels (nine bytes).

## 5.7.3 18-bit per Pixel, Long Packet, Data Type 101110 (2Eh)

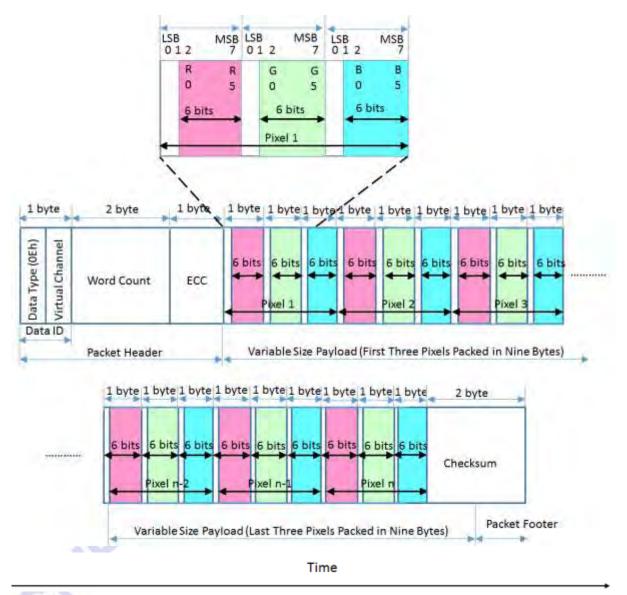

Figure 5.7.3-1: 18-bit per Pixel (Loosely Packed) - RGB Color Format, Long Packet

In the 18-bit Pixel Loosely Packed format, each R, G, or B color component is six bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires three bytes as it is transmitted across the Link. This requires more bandwidth than the "packed" format, but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the Link. This format is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum.

The pixel format is red (6 bits), green (6 bits) and blue (6 bits) in that order. Within a color component, the LSB is sent first, the MSB last. With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

# 5.7.4 24-bit per Pixel, Long Packet, Data Type 111110 (3Eh)

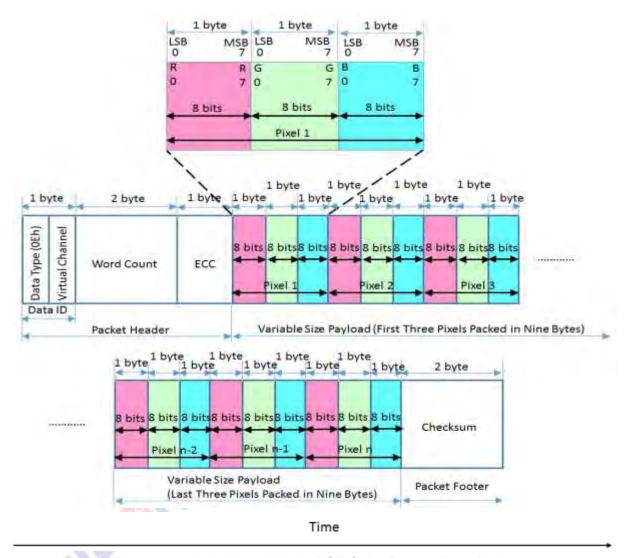

Figure 5.7.4-1: 24-bit per Pixel - RGB Color Format, Long Packet

Packed Pixel Stream 24-Bit Format is a Long packet. It is used to transmit image data formatted as 24-bit pixels to a Video Mode display module. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. The pixel format is red (8 bits), green (8 bits) and blue (8 bits), in that order. Each color component occupies one byte in the pixel stream; no components are split across byte boundaries. Within a color component, the LSB is sent first, the MSB last.With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

# 6 Functions

#### 6.1. Oscillator

The ICNL9706 can oscillate an internal R-C oscillator with an internal oscillation resistor. The oscillation frequency is changed according to the internal register if needed. The default frequency is 45MHz. The oscillation frequency tolerance is ±5%.

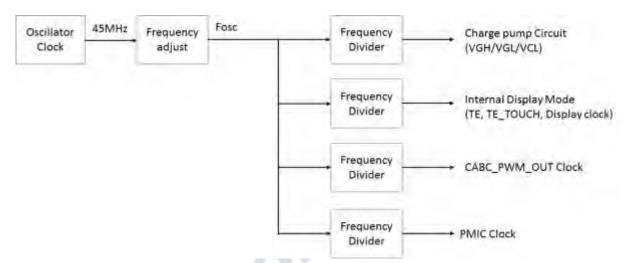

Figure 6.1-1: Oscillator architecture

SHIPSINE

## 6.2 Content Adaptive Brightness Control (CABC)

The CABC, a dynamic backlight control function, drastically reduces the power consumption of the luminance source. The ICNL9706 will refer the gray scale content of the display image to output in PWM waveform then to the LED driver for backlight brightness control. The content of gray scale can be increased while simultaneously lowering the brightness of the backlight to achieve the same perceived brightness. The adjusted gray level scale and the power consumption reduction depend on the content of the image.

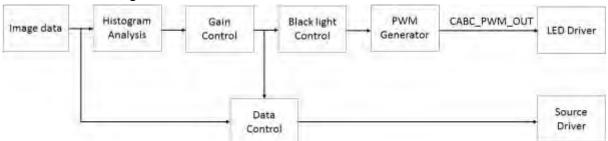

Figure 6.2-1: CABC Block Diagram

The ICNL9706 can calculate the backlight brightness level and send a CABC\_PWM\_OUT pulse to the LED driver via CABC\_PWM\_OUT pin for backlight brightness control purposes. The PWM frequency can be adjusted by PWM\_DIV parameters, and the calculating equation is shown below:

$$f_{CABC\_PWM\_OUT} = \frac{32MHz}{(PWM\_DIV[7:0]+1)x255}$$

#### 6.3 Gamma Function

The structure of grayscale amplifier is shown as below. The 19 voltage levels between VSPR and VSNR are determined by the gradient adjustment register, the reference adjustment register, the amplitude adjustment resister and the micro- adjustment register.

## 6.5 Tearing Effect

### 6.5.1 Tearing effect output line

The Tearing Effect output line supplies a panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize frame memory writing when displaying video images. Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

## 6.6 Sleep Out - Command

#### 6.6.1 Register loading detection

Sleep Out-command (See "Sleep Out (11h)") is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP (or similar device) to registers of the display controller is working properly. There are compared factory values of the OTP and register values of the display controller by the display controller. If those both values (OTP and register values) are same, there is inverted (=increased by 1) a bit, which is defined in command "Read Display Self-Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (=increased by 1). The flow chart for this internal function is following:

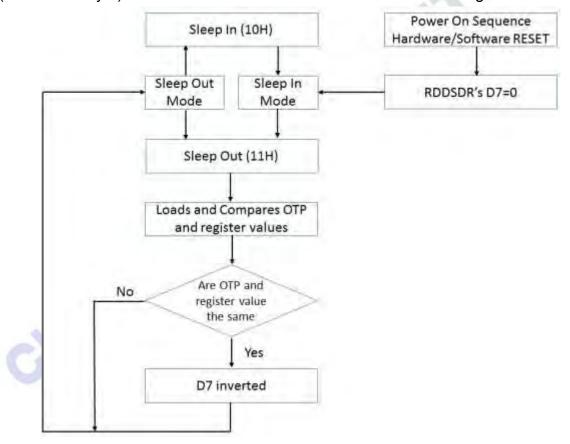

Figure 6.6-1: Sleep out flow chart-command and self-diagnostic functions

### 6.6.2 Functionality detection

Sleep Out-command (See "Sleep Out (11h)") is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements. The internal function (=the display controller) is comparing, if the display module still meets functionality requirements (e.g. booster voltage levels, timings, etc.). If functionality requirement is met, 1 bit will be inverted (=increased by 1), which is defined in command "Read Display Self- Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D6). If functionality requirement is not the same, this bit (D6) is not inverted (=increased by 1). The flow chart for this internal function is shown as below.

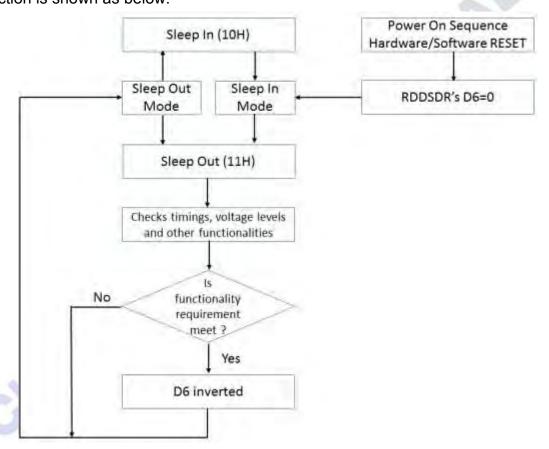

Figure 6.6.2-1: Sleep out flow chart internal function detection

Note: There is needed 120msec. After Sleep Out –command, when there is changing from sleep In –mode to Sleep Out –mode, before there is possible to check if Customer's functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out –command is sent in Sleep Out –mode.

# 7. Power On/ OFF Sequence

# 7.1. Power ON Sequence

If RESX line is held high or unstable by the host during Power On, then a Hardware Reset must be applied after both VCI and IOVCC have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum 10µsec after both VCI and IOVCC have been applied. The power on sequence for different power input modes are shown below figures.

SD1[7:0]: These registers are used to set EQ pull gnd time. Register Step 4 x Osc clock.

SD2[7:0] : These registers are used to set EQ pre-charge to VCI/ IOVCC/ VCL time. Register Step  $4 \times Osc clock$ .

SD3[7:0]: These registers are used to set source Data + / Data- output time. Register Step  $4 \times Osc clock$ .

 $\mathsf{OP}_{\mathsf{ON}[7:0]}$ : These registers are used to set source  $\mathsf{OP}$  enable time. Register Step 4 x  $\mathsf{Osc}$  clock.

OP\_OFF[7:0]: These registers are used to set source OP disable time. Register Step 4 x Osc clock.

## 11 \ Important Notice

Chipone Technology (Beijing) Co., Ltd. (Chipone) reserves the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

Chipone warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with Chipone's standard warranty. Testing and other quality control techniques are utilized to the extent Chipone deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). CHIPONE SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF CHIPONE PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

Chipone assumes no liability for applications assistance or customer product design. Chipone does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of Chipone covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. Chipone's publication of information regarding any third party's products or services does not constitute Chipone's approval, warranty or endorsement thereof.
